The present sequence is the coding sequence of the Pasteurella multocida chondroitan synthase PmCS. PmCS catalyses glycosaminoglycan polymerization to produce chondroitan: a linear polyacacharide which has viscoelastic properties which makes it useful for a number of applications. Chondroitan can be used with hyaluronic acid (HA) to coat medical devices e.g. catheters and sensors to reduce tissue abrasion. In addition, they can be used as bloadhesives for haemostatic sealing and healing of wounds and surgical incisions; and as biomaterials that provide sustained delivery of encapsulated drugs, to wounds, ulcers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        multocida chondroitin synthase. A chondroitin polysaccharide may be used as a hyaluronan polysaccharide substitute in medial or cosmetic applications, for example in eye or joint applications, for moisturiser or wound dressings. The enzyme may be used in covalently coupling specific drugs, proteins or toxins to the structurally modified procedures, covalently cross linking the hyaluronic acid itself or to other supports to achieve a gel or other three dimensional biomaterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the coding sequence of the Pasteurella

The present invention relates to the coding sequence of the Pasteurella multocida chondroitin synthase. A chondroitin polysaccharide may be used as a hyaluconan polysaccharide substitute in medial or cosmetic applications, for example in eye or joint applications, for moisturiser or wound dressings. The enzyme may be used in covalently coupling specific drugs, proteins or toxins to the structurally modified chondroitin for general or targeted drug delivery or radiological procedures, covalently cross linking the hyaluronic acid itself or to other supports to achieve a gel or other three dimensional biomaterial with stronger physical properties, and covalently linking hyaluronic acid to a surface to create a biocompatible film or monolayer. The present sequence is one version of the coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enzyme
                                                                                       This DNA sequence codes for the hyaluronate synthase (pmHAS, see AAY06212) of Pasteurella multocida Carter Type A. The pmHAS enzym has different kinetic optime with respect to pH and metal ion dependence, and different Km values compared with the HAS enzymes of Streptococcus equisimilis (see AAY06206) and Streptococcus sorter and about 2 to 3 -fold lower for UDP sugars, and Vmax values are about 2 to 3 -fold higher. The invention provides recombinant vectors containing hyaluronate synthase DNA,

especially S. equisimilis hyaluronate synthase DNA (see AAX58841), and prokaryotic or eukaryotic host cells which produce the enzyme and its hyaluronic acid product, particularly a product with modified structure or molecular size. The hyaluronic acid produced this way is purer than that produced by conventional methods.
                                                                                                                                                                                                                                                                                                                                                                  43 ATTTTTAAAGGAAAGAAAATGAATACATTATCACAAGCAATAAAAGGCATATAACAGCAAT

Hyaluronic acid (HA) or hyaluronan, is a polysaccharide that serves both structural and recognition roles in higher animals. Bacteria produce extracellular capsules of HA which minic their host HA and aid escape from a host immune response. The invention includes a vector containing the PMHAS nucleotide sequence which can be used to production of HA. Also, specific changes to the HS coding sequence can result in the production of HA having a modified size distribution or structural configuration and functional properties. The HA products can be used in e.g. drug delivery, angiogenesis and wound healing, structural configuration for the production of companies of the combinant proteins and in cosmetics. The HA nucleic scan structural configuration of recombinant proteins and consentics. The HB nucleic scan state an also be used to develop agents to block capsule synthesis by pathogens and act as antibiotics. The avigulent P, multocida strains can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated hyaluronate synthase nucleic acids, used for the production of hyaluronic acid, for developing antibiotics and vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180

The present sequence is the coding sequence of the soluble recombinant form of Pasteurealla multocida hyaluronic acid synthase-D, PmHAS-D. This sequence encodes residues I to 703 of the 972 residues of the native PmHAS enzyme. PmHAS-D catalyses glycosaminoglycan polymerisation to produce hyaluronic acid, HA: a linear polysaccharide. HA has viscoelastic produce hyaluronic acid, HA: a linear polysaccharide. HA has viscoelastic consections which makes it useful for a number of applications. HA can be used during ophthalmic surgery as a viscoelastic replacement for the vitreous humour e.g. during implantation of intraocular lenses in cataract patients. HA nijections directly into joints is also used to alleviate pain associated with arthritis. HA can also be used to cat medical devices e.g. catheters and sensors to reduce tissue abrasion. HA can also be used as bioadhesives for haemostatic sealing and healing of wounds and surgical incisions; and as biomaterials that provide sustained delivery of encapsulated durys, to wounds, ulcers, injuries or surgical sites. The present sequence can therefore be used to produce HA.

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. AAX12938 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to

The present invention relates to nucleic acid sequences (ABG67188-ABG71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines.
                                                                                                                                                                                                                                  1356 ACCTITAGITICIATITAFATCCCCGCTTATAACTGTGCAAATTATATTCAAAGATGTGT 1415

                                                                                                                                                                                                                                             The present invention relates to nucleic acid sequences are useful as probes and ABA671812) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of spene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exopolysaccharide; EPS; ESP enzyme; EPS1; EPS2; EPS3; EPS4; EPS5; EPS6; EPS6; EPS9; EPS10; Streptococcus thermophilus strain Sf139; activated D-galactose epranose; saccharide; beta-glycosyltransferase; transporter; food; fermented milk product; yoqhurt; cheese; flavour stability; organoleptic property; so.

These enzymes are designated EPS1-EPS10, and are encoded by open reading frames eps1-eps10. The enzymes are isolated from Streptococcous thermophilus strain Sf139. The proteins are used in a method for the synthesis of EPS, which includes at least one step of forming a bond (alpha or beta-isomer) between C-1 (carrying the reducing aldehyde function, of an activated D-galactose pyranose), and a phosphate on a lipophilic or proteinaceous primer. Stepwise synthesis of EPS occurs with, in each step, addition of a new sugar unit, through its hemi-acetyl function, to an alcoholic hydroxyl of a second sugar

ö
unit, present at the end of a chain of sugar residues bonded to the primer. EpS1 to EpS4 are used to elongate the EPS chain, and to regulate EPS production, BPS5 creates new bonds between saccharides, EPS6 is used in the biosynthesis of EPS, and EPS9 and EPS9 are beta-glycosyltransferases, EPS9 is a transporter of repetitive units, and EPS10 catalyses the conversion of a pyranose form of a beta-1-galactose to the furanose form. The EPS enzyme are used to improve properties of foods, particularly fermented milk products such as yoghurt and cheese, e.g. their organoleptic properties and flavour stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CGCTAGCAGTAATTTCCGATTTAATCTGTAGTCATCATAATATTAAGGTAATCAACCAAA 13033

The operon contains 10 open reading frames, and encodes enzymes (eps1, eps2, eps3, eps5, eps6, eps7, eps8, eps9 and eps10) that are involved in the biosynthesis of exopolysaccharides (EPS). The enzymes catalyse the formation of specific intersugar bonds. The enzymes catalyse a process that includes at least one step of forming a bond (in alpha or beta anomeric form) between Cl, carrying the reducing aldehyde group of an activated D-Galp (galactose in pyranose form), and a phosphate group on a lipophilic or proteinaceous primer. The enzymes are used to produce Eps that have antitumor or problotic properties or are used in foodstuffs to improve organoleptic qualities and flavour. When expressed by lactic acid bacteria, EPS impart

are useful for synthesising simply atted oligosaccharides such as ganglioside, lysoganglioside or their mimics. Glycosyltransferases are useful for chemo-enzymatic synthesis of oligosaccharides, including gangliosides and other oligosaccharides that have including gangliosides and other oligosaccharides that have biological activity. The enzymes and nucleic acids that encode them are useful for studies of the pathogenesis mechanisms of organisms that synthesize ganglioside mimics, such as C. jejuni and the conclete acids are used as probes to study expression of genes involved in ganglioside mimetic synthesis. Antibodies raised against the glycosyltransferases are also useful for analyzing the expression patterns of these genes involved in pathogenesis. The oligonucleotides for inhibiting expression of the Campylobacter oligonucleotides for inhibiting expression of the Campylobacter carrymes that are involved in the biosynthesis of ganglioside mimics that can mask the pathogens from the host's immune system. The oligosaccharides are useful as diagnosing reagents or as therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A reaction mixture for the synthesis of a sialylated oligosaccharide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and as immunogens for producing antibodies. Bacterial glycosyltransferase can be used to catalyse the formation of oligosaccharides that are identical to the corresponding mammalian structures and are asier and less expensive to produce in large quantity, compared to the mammalian glycosyltransferase. The bacterial origin of the enzymes facilitates expression of large quantities of the enzymes using relatively inexpensive prokaryotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          P-PSDB; AAY97200, AAY97201, AAY97202, AAY97203, AAY97204, AAY97205

                invention provides a number of human immune system associated
                              genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          6462
                                                                                   macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilopsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               6642

                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid relukaemia, Alzheimer's disease, Alzheitepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

Patent No. 595368

GENERAL INFORMATION:
APPLICANT: Johnson, Eric A.
APPLICANT: Broad, Julian:
TITLE OF INVENTION: Expression System for Clostridium:
TITLE OF INVENTION: Species
NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
ADDRESSEE: Quarles & Brady
STREET: 1 South Pinckney Street
CITY: Madison
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Mismatches 362; Indels

Sequence 1, Application US/09816028A

Patent No. US20020042369A1

SEMERAL INFORMATION:

APPLICANT: Gilbert, Michel

APPLICANT: Makarchuk, Warren W.

APPLICANT: National Research Council of Canada

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Gangliosides and Ganglioside Mimics

CURRENT APPLICATION NUMBER: US/09/816,028A

CURRENT FILING DATE: 2001-03-21

PRIOR APPLICATION NUMBER: US 60/118,213

PRIOR APPLICATION NUMBER: US 60/118,213

PRIOR APPLICATION NUMBER: US 60/118,213

PRIOR PRILING DATE: 2000-01-31

NUMBER OF SEQ ID NOS: 49

SEGTWARER PREED PATENTING DATE: 2000-01-31

SEGTWARER PREED PATENTING DATE: 2000-01-31

Fatent No. US20020042369A1

GENERAL INFORMATION:
APPLICANT: Gilbert, Michel
APPLICANT: Watron W.
APPLICANT: Wational Research Council of Canada

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of
TITLE OF INVENTION: Ganqliosides and Ganglioside Mimics

FILE REFERENCE: 019633-0001110S

CURRENT APPLICATION NUMBER: US/09/816,028A

CURRENT FILING DATE: 2001-03-21

FRIOR FILING DATE: 1999-02-01
